

# Factcheck

Adapting quality of VET offer to the need  
of industry – manufacturing sector

## Metal & Electro Qualifications

Skills required by companies

Erasmus+

# Agenda – Day 1

## 01 Introduction

- Welcome and Opening
- Short introduction to the project and its objectives

10:00

10:20

## 02 Skills demand - METAL

- Overview of company feedback
- EU-wide and national properties

10:20

11:00

11:30

---

## 03 Skills demand - ELECTRO

- Overview of company feedback
- EU-wide and national properties

12:00

12:40

13:10

## 04 Discussion

- Conclusion
- Challenges for vocational education: EU and national issues

13:10

14:00

# 1. Introduction

Project partner organisations  
and its profile

Short summary about the project's  
objectives, milestones and results

01

**BSW**  
Bildungswerk der  
Sächsischen  
Wirtschaft

02

**Formac**  
Spolka z ograniczona odpowiedzialnoscia  
SKA  
of Education and Innovation

03

**Center**

04

**Asociacion**  
de empresarios  
del comercio e  
industria del metal  
de Madrid

05

**Panepistimio**  
Thessalias

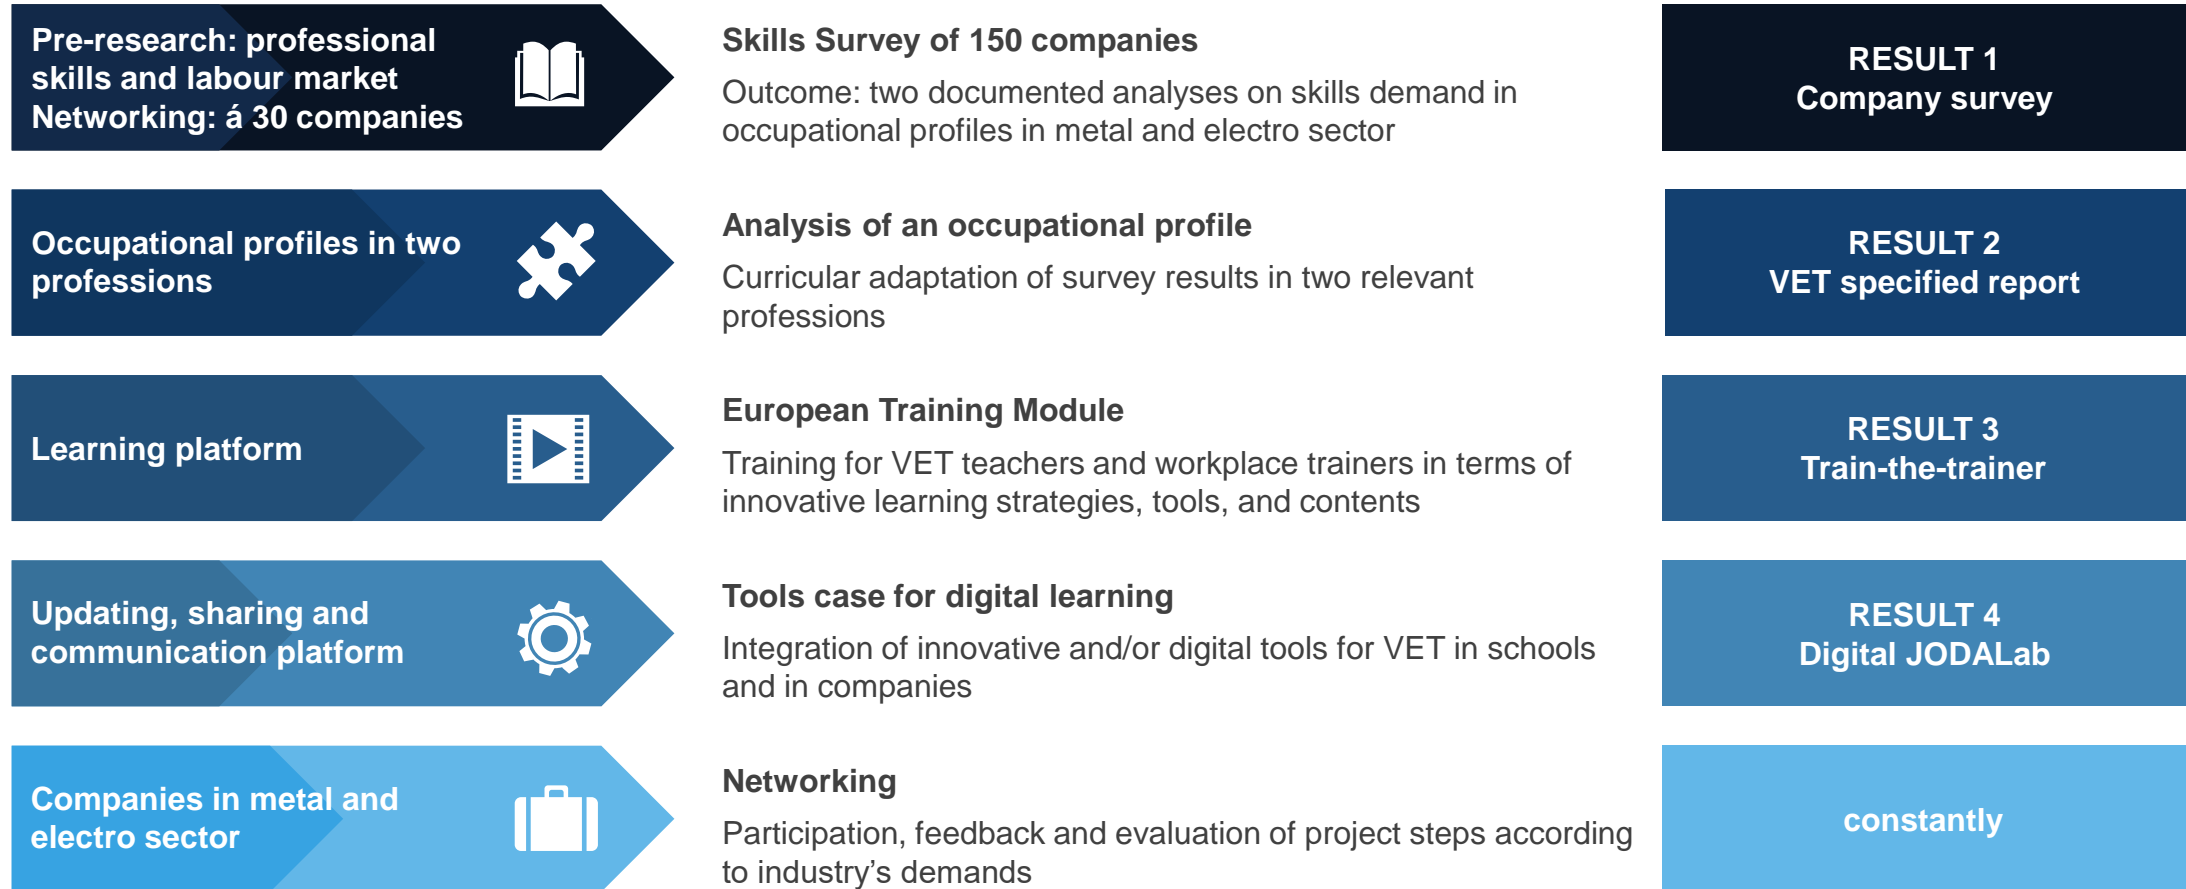

06

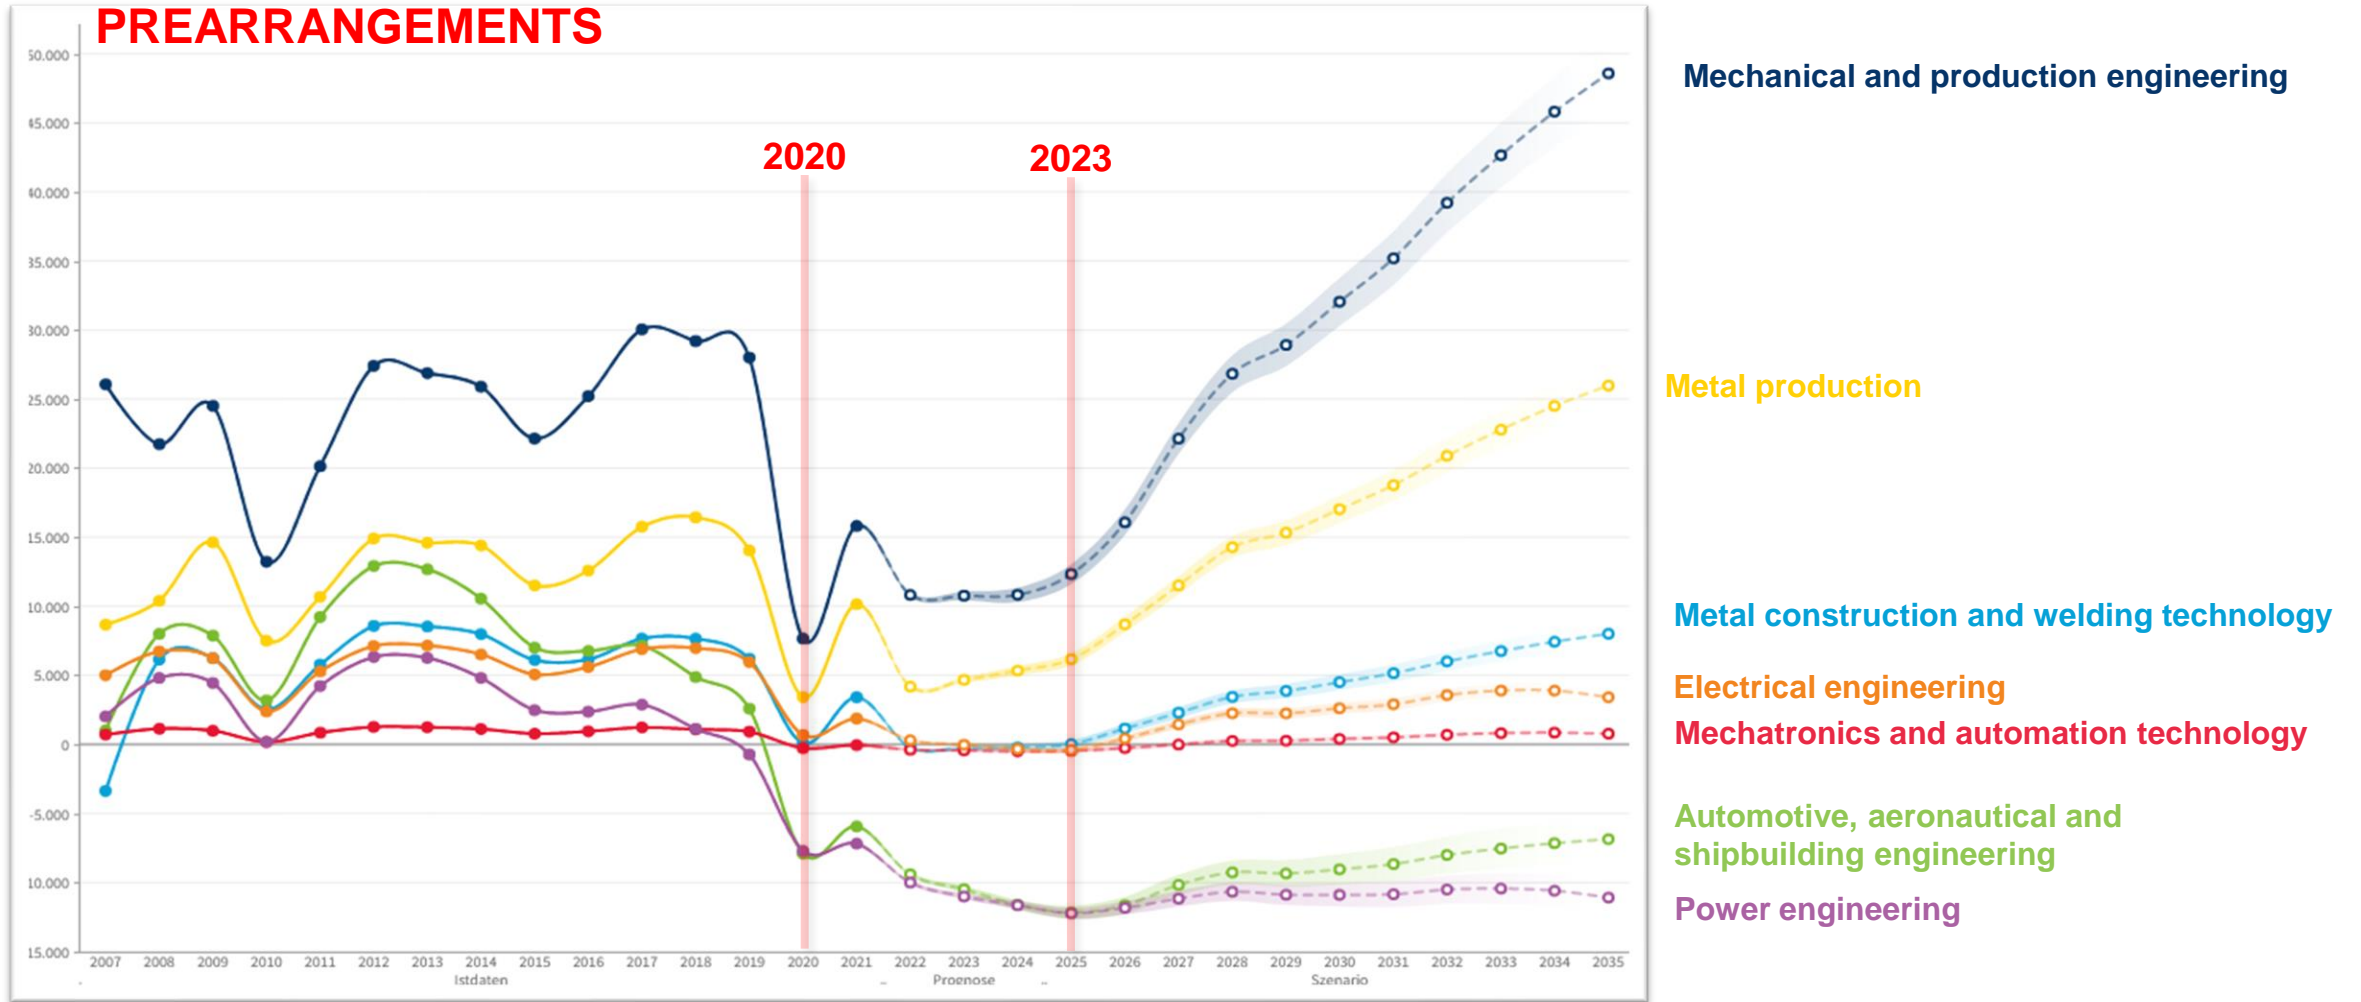

**Sdruzhenie**  
Bulgarska  
targovsko-  
promishlena  
palata

# 1. Project FactCheck

# 1. Occupational profiles

Skilled workers monitor – Pilot region in Germany, November 2022

# 1. Occupational profiles

## PREARRANGEMENTS

Industrial electrician  
for industrial  
engineering

Electronics  
technician for  
industrial engineering

Electronics  
technician for devices  
and systems

Industrial electrician  
for devices and  
systems

Machine and systems  
operator

Industrial mechanic

Mechatronic engineer

Specialist in metal  
technology

Tool mechanic

# 1. Occupational profiles

# 1. Company survey

**Company information**  
Name, country, profile

**Extended view**  
Ownership, Company structure, economic  
and labour characteristics

**Current demands**  
Advanced qualification, most wanted  
profiles and skills

**Adaptation in VET**  
Requirements to human resources: trainer  
and students

# 1. Company survey

Company feedbacks:  
National overview

Appropriate analysis:  
EU-wide comparison

40

Germany

30

Poland

32

Greece

35

Spain

31

Bulgaria

# 1. Company survey

Reports on skills demand in occupational profiles of metal and electro sector

# Expectations

# What VET-related topics are you interested in?

1st

company challenges while searching for qualified employees

2nd

occupational profiles in metal & electro sector

3rd

job-related skills

4th

relevant occupation-specific tasks

# How precisely do you know professional competences in metal and electrical occupations?

# How do you establish contact between companies and vocational schools?

# Agenda – Day 1

## 01 Introduction

- Welcome and Opening
- Short introduction to the project and its objectives

10:00

10:20

## 02 Skills demand - METAL

- Overview of company feedback
- EU-wide and national properties

10:20

11:00

11:30

---

## 03 Skills demand - ELECTRO

- Overview of company feedback
- EU-wide and national properties

12:00

12:40

13:10

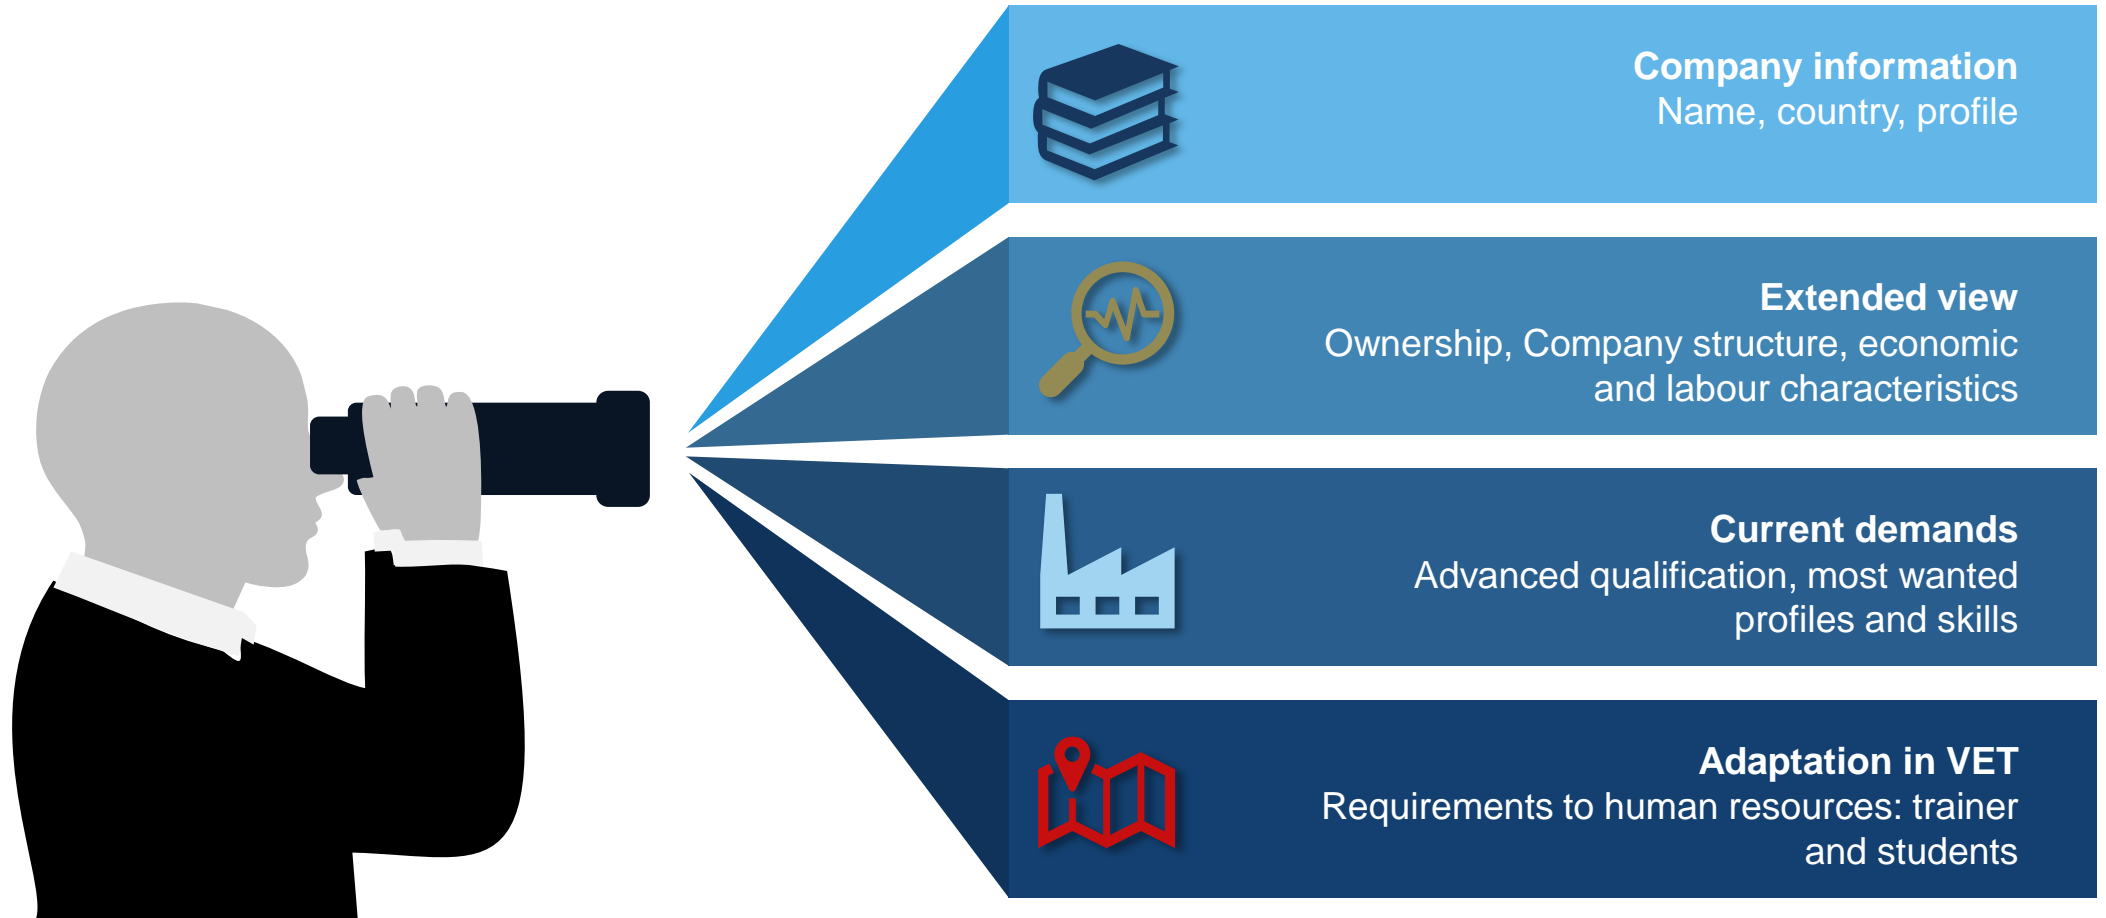

## 04 Discussion

- Conclusion
- Challenges for vocational education: EU and national issues

13:10

14:00

# 2. Skills demand: Survey

# 2. Skills demand - Survey

14:00

# 4. Discussion: Overview

**METAL**  
Machine and systems operator

**ELECTRO**  
Electronics technician for devices and systems

# 4. Discussion: Tasks

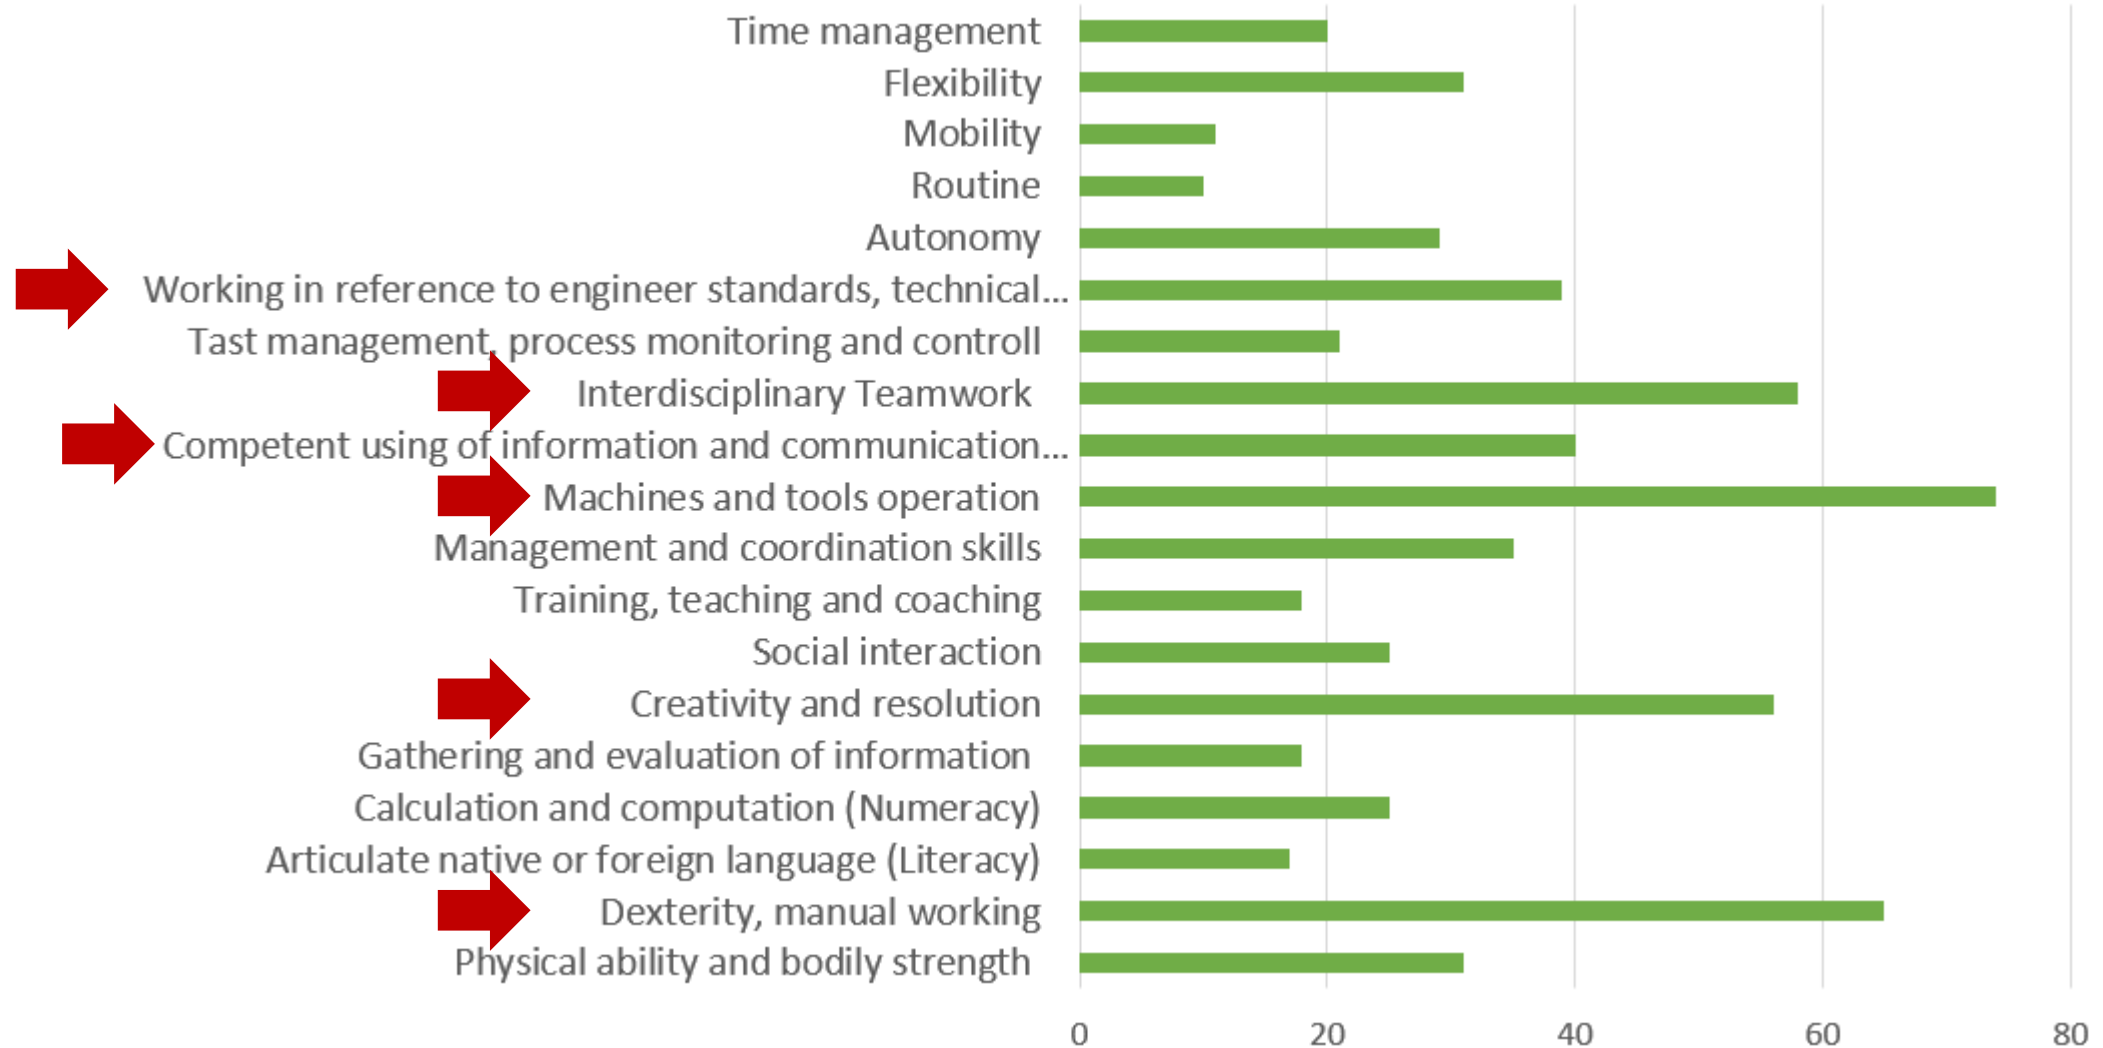

-  Common tasks
-  ELECTRO-specific tasks
-  METAL-specific tasks

-  Mechanical and electrical installation (including high voltage...)
-  Defect analysis and repairing machines and technical equipment
-  Engineering detail drawing
-  Robotics, robot handling and automatisaton
-  Operation on CNC machine tools
-  CAD Programming, e.g. SolidWorks
- 3D printing: programming, printing, postprocessing

# 4. Discussion: Competences

# 4. Discussion: Competences

**Dexterity**

**Professional qualification**

Guided speed-training

**Teamwork**

**Communicative skills**

Digital team meetings

**Creativity/Resolution**

**Individual capacity**

Interdisciplinary tasks

**Competent use of information**

**Learning capability**

Using technical documentation

**Engineer standards**

**Methodological expertise**

Spatial sense and orientation

**Machines and tools**

**Professional qualification**

Digital twin

# 4. Discussion: Competences

*Please join: [rb.gy/rdpp1](https://rb.gy/rdpp1)*

A person wearing a white dress shirt is shown from the chest down, with their arms slightly out. The background behind them is a dense cityscape, likely New York City, with many skyscrapers and buildings. The lighting is warm, suggesting a sunset or sunrise.

# Day 2 PREVIEW

## Considerations for occupational training

### 01 Introduction

- Relevant preliminary considerations of vocational education
- Role of the trainer, prerequisites of the trainees (Generation Z)

### 02 Training in general

- General and specific competences and objectives

### 03 Occupational training

- Topic, brief content, goals
- Metal and Electro

### 04 Implementation

- Methods in discussion
- Feedback

# Feedback

# What VET-related topics you were today well informed in?

# What did you experience today about occupational profiles in metal and electro sector?

# How can you use the findings of today's event?

# Thank you!

Erasmus+

# Factcheck

Adapting quality of VET offer to the need  
of industry – manufacturing sector

# Expectations

# How precisely do you know the requirements on VET 4.0?

# What are the most significant issues of Generation Z?

# What are the most relevant issues of digital learning?

# Agenda – Day 2

## 01 Introduction

- Key findings from Day 1
- Skills required by companies

10:00

10:20

## 02 Vocational education

- Role of the trainer, prerequisites of the trainees
- Initial design of European Training Modules

10:20

11:00

11:30

---

## 03 Occupational training

- Topics, brief content, goals
- Electro and Metal in particular

12:00

12:45

13:30

## 04 Discussion

- Conclusion
- Implementation methods: EU and national issues

13:30

14:00

# 2. Vocational education

**Innovations in production:**

- Automation
- Technologies
- Networking

**Industry 4.0**

**Adequately qualified staff:**

- Ensuring the production process
- Transformation of competences

**Working world 4.0**

**HR development**

**Qualified and trained staff:**

- Further training in line with requirements
- Resource management

**Vocational education**

**Practical vocational training:**

- Professional knowledge, skills and abilities
- Directly usable on the labour market

# 2. Vocational education

Efficient work in complex data-based systems

Interdisciplinary

Virtual collaboration

With different responsibilities

From different disciplines

Learning platform

Preparatory or directly in the work process

Independent or guided

Ongoing and sustainable

Technical communication

Possibilities and dangers of media technologies

## 2. Vocational education

**Well-trained skilled workers help determine the success of the company!**

# 2. Vocational education

## Vocational orientation

### Attractiveness of vocational education and training

#### Advantages of digital methods:

- Independent of time and place
- Individual in the course
- Can be repeated as often as desired
- Specialised in target group and subject area

## Vocational education

### Professional skills

#### Advantages of digital methods:

- Expert knowledge
- Reduction of the probability of errors
- Applicable in and outside production
- Cost-efficient
- Sustainable
- Updatable

## Further qualification

### Skilled workforce

#### Advantages of digital methods:

- Further training of the workforce
- Adapted to the needs of the company
- Applicable on- and off-the-job
- Part-time
- Integrated into personnel development strategy
- Safeguarding productivity

# 2. Vocational education

## Generation Z

Digital natives

Technologies

“Fast and furious”

Reactions

Feedback

Work life balance

Digitalisation

Connected

# 2. Vocational education

**Volatility**  
Rate of change

**Complexity**  
Multiple key decision factors

**Uncertainty**  
Unclear about the present

**Ambiguity**  
Lack of clarity about meaning of an event

# 2. Vocational education

## 4 C's of education

From knowledge transfer to skills transfer

Skills that cannot be digitised:

- Creativity
- Critical thinking
- Communication
- Collaboration

Creativity

Critical thinking

4 C's of education

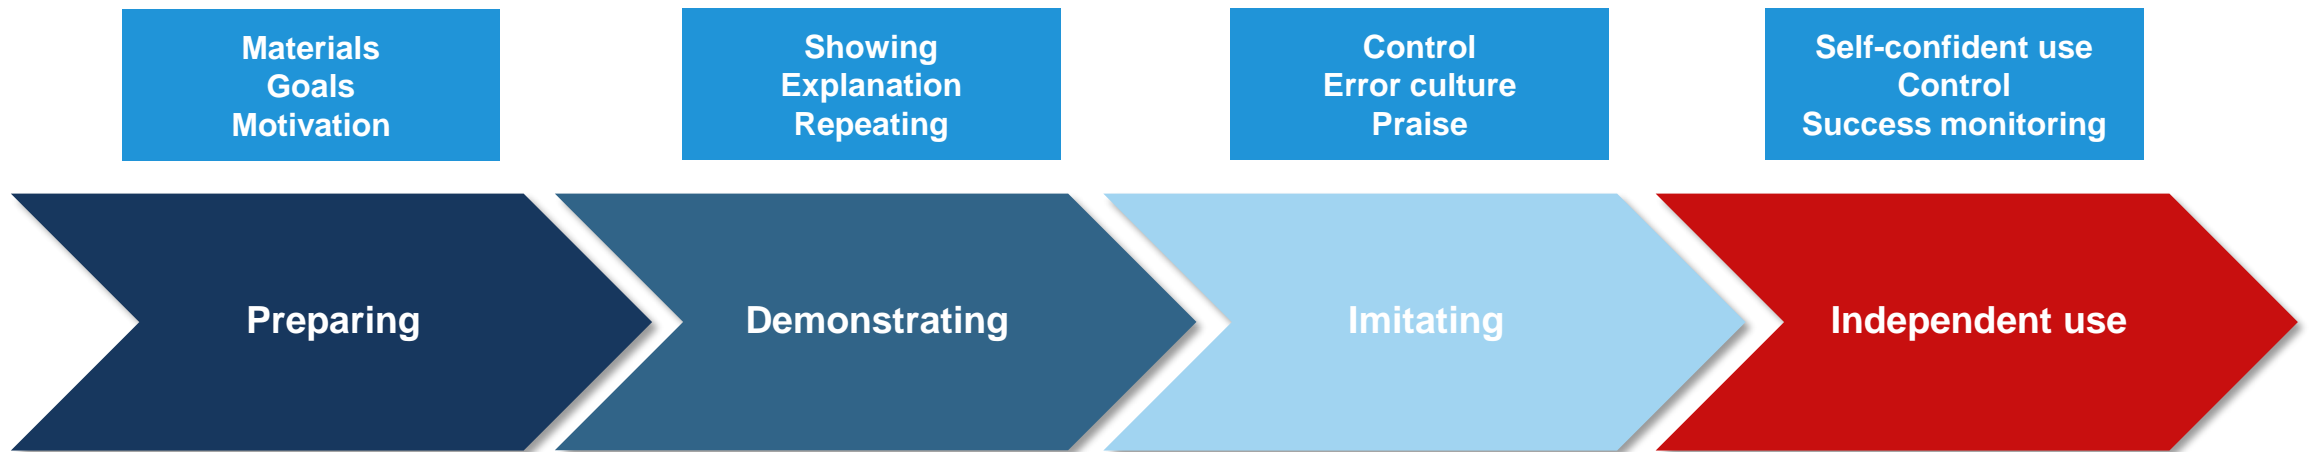

Communication

Collaboration

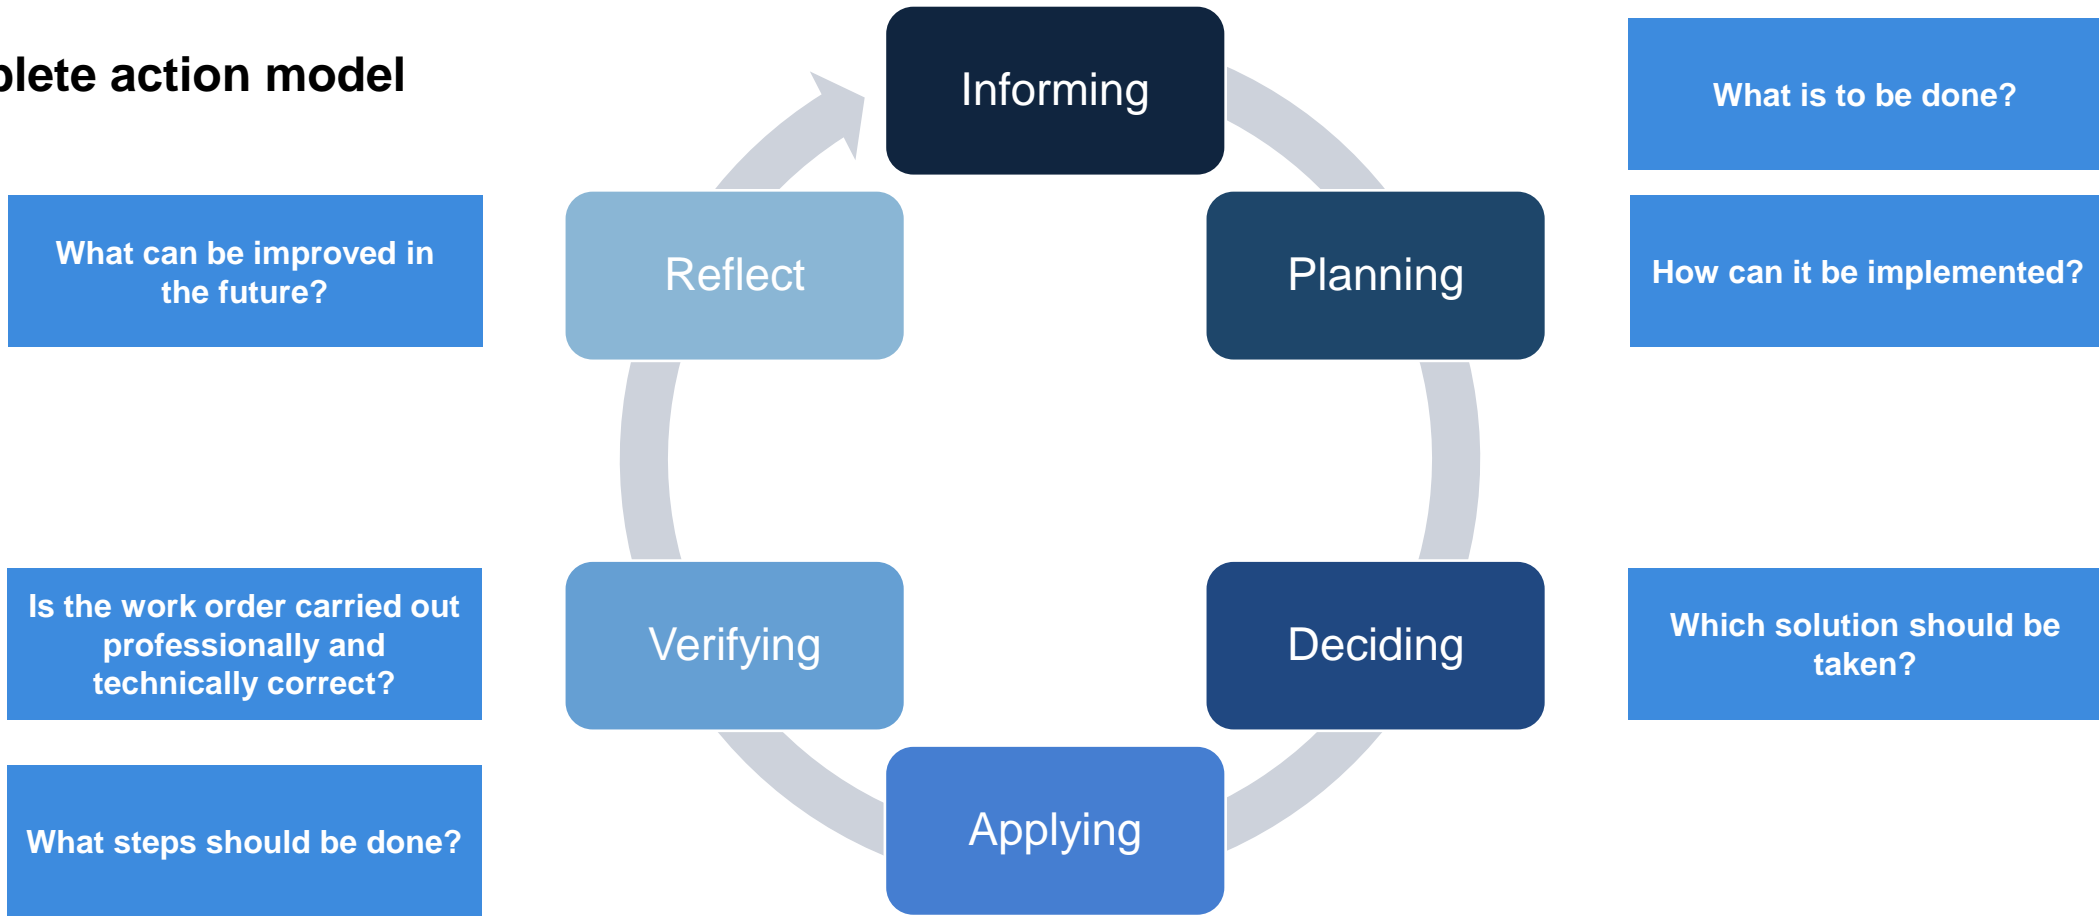

# 2. Vocational education

## Conventional model of VET

# 2. Vocational education

## Complete action model

# 2. Vocational education

## Complete action model

Self-determined learning  
Get feedback

Accompany the learning process  
Give tasks and support

Media affinity  
Variety of methods

Digital learning

# 2. Vocational education

## Complete action model

### Advantages

- Connecting theory and practice
- Encouraging independent work
- Strengthening of key competences
- Can be used in individual and group work
- Learning and applying presentation and creativity techniques

### Disadvantages

- Changing the training method can be time-consuming
- Can be too much for trainees at first
- Work equipment must be available

11:00 -  
11:30 AM

# Agenda – Day 2

## 01 Introduction

- Key findings from Day 1
- Skills required by companies

10:00

10:20

## 02 Vocational education

- Role of the trainer, prerequisites of the trainees
- Initial design of European Training Modules

10:20

11:00

11:00

---

## 03 Occupational training

- Topics, brief content, goals
- Electro and Metal in particular

11:30

12:00

13:00

## 04 Discussion

- Conclusion
- Implementation methods: EU and national issues

13:00

14:00

# 3. Occupational training

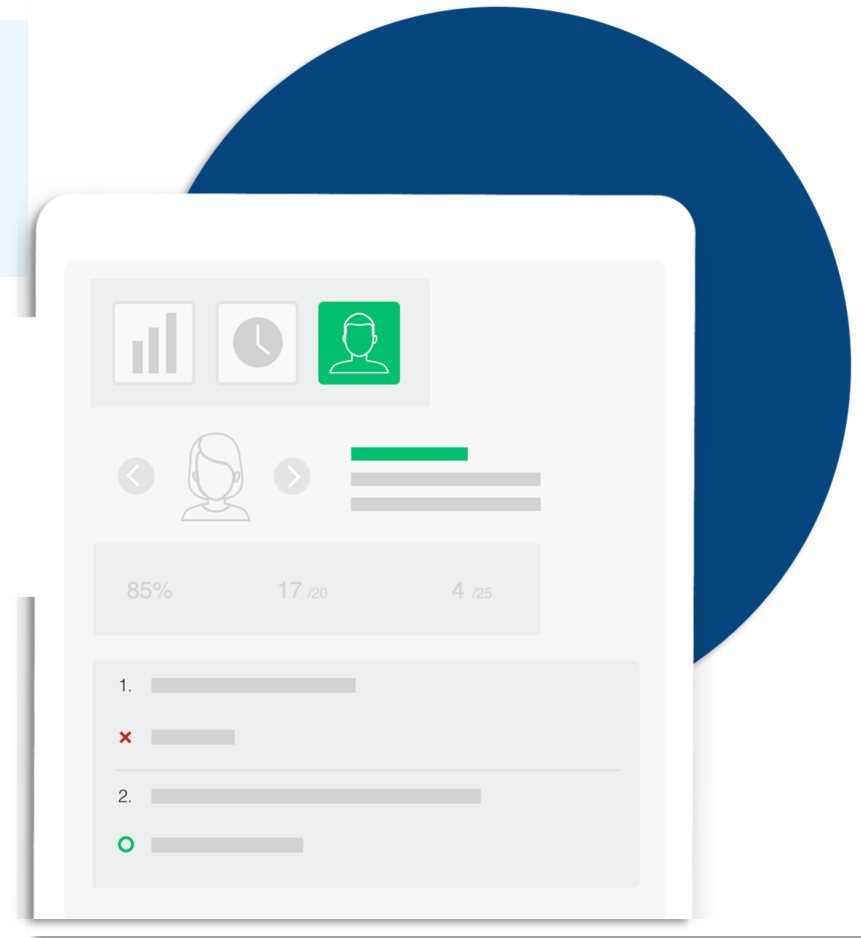

# 3. Occupational training

## Assessment of the state of knowledge

- Real-time evaluation
- Can be used during lessons
- Anonymous or personalized
- Monitoring of the learning process

- ✓ Independent of time and place
- ✓ Individual in the course
- ✓ Can be repeated as often as desired
- ✓ Specialised in target group and subject area

# 3. Occupational training

- ✓ Independent of time and place
- ✓ Individual in the course
- ✓ Can be repeated as often as desired
- ✓ Specialised in target group and subject area

- ✓ Expert knowledge
- ✓ Cost-efficient and resource-saving
- ✓ Sustainable and updatable

## Creation of teaching materials

- Task sheets
- Presentations
- Interactive learning paths
- Integration of audio and video media

# 3. Occupational training

- ✓ Independent of time and place
- ✓ Individual in the course
- ✓ Can be repeated as often as desired
- ✓ Specialised in target group and subject area
- ✓ Expert knowledge
- ✓ Cost-efficient and resource-saving
- ✓ Sustainable and updatable

## Media learning

- Recordings of the work and production processes
- Notes and explanations
- Audiovisual tasks

# 3. Occupational training

- ✓ Independent of time and place
- ✓ Individual in the course
- ✓ Can be repeated as often as desired
- ✓ Specialised in target group and subject area
- ✓ Expert knowledge
- ✓ Cost-efficient and resource-saving
- ✓ Sustainable and updatable

## Simulation environments

- Virtual working environment
- Based on operational work processes
- Far away from production
- Targeted training of malfunctions

# 3. Occupational training

- ✓ Independent of time and place
- ✓ Individual in the course
- ✓ Can be repeated as often as desired
- ✓ Specialised in target group and subject area
- ✓ Expert knowledge
- ✓ Cost-efficient and resource-saving
- ✓ Sustainable and updatable
- ✓ Out of the production

## Training area

- Operational production processes in a controlled environment
- Away from production
- Within the company structure
- Interdisciplinary
- Fully comprehensive work processes

# 3. Occupational training

- ✓ Independent of time and place
- ✓ Individual in the course
- ✓ Can be repeated as often as desired
- ✓ Specialised in target group and subject area
- ✓ Expert knowledge
- ✓ Cost-efficient and resource-saving
- ✓ Sustainable and updatable
- ✓ Out of the production

## Virtual reality

- Realistic simulation in a controlled environment
- Far away from production
- Operational production processes
- Interdisciplinary
- Fully comprehensive work processes
- Training of incidents

# 3. Occupational training

- ✓ Independent of time and place
- ✓ Individual in the course
- ✓ Can be repeated as often as desired
- ✓ Specialised in target group and subject area

- ✓ Expert knowledge
- ✓ Cost-efficient and resource-saving
- ✓ Sustainable and updatable
- ✓ Reduction of the probability of errors
- ✓ Applicable in and outside production

## Augmented reality

- Part-time
- On-/Off-the-job
- Additional information
- Warnings
- Technical communication

# 3. Occupational training

- ✓ Independent of time and place
- ✓ Individual in the course
- ✓ Can be repeated as often as desired
- ✓ Specialised in target group and subject area
- ✓ Expert knowledge
- ✓ Cost-efficient and resource-saving
- ✓ Sustainable and updatable
- ✓ Reduction of the probability of errors
- ✓ Applicable in and outside production

## Assistance systems

- Integration into production processes
- Guidance of work steps
- Quality assurance
- For every level of qualification
- Increasing productivity

# 3. Occupational training

Overview

Needs assessment

Concept

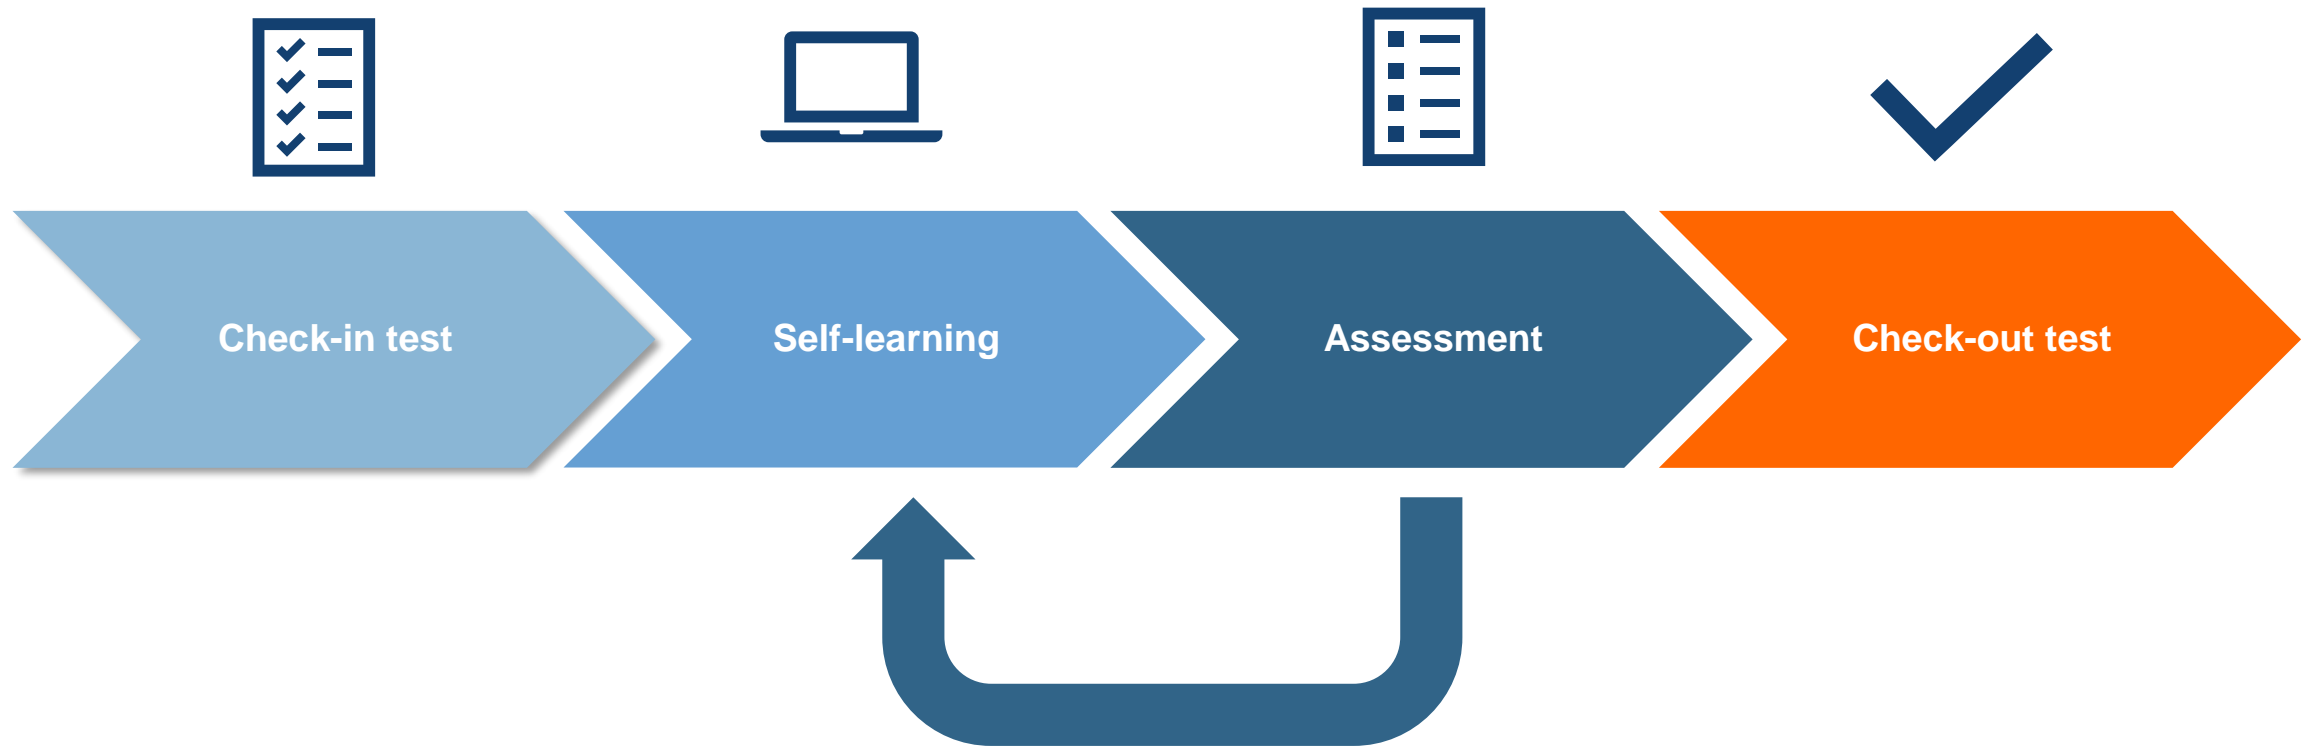

Evaluation

Implementation

# 3. Occupational training

Online training module: Learning pathway

# Agenda – Day 2

## 01 Introduction

# 3. Localisation: Metal

Check-in knowledge test

Self-learning phases, each with a subsequent test

- 2a. Welding robots: components and mode of operation
- 2b. Welding: Basics and Safety
- 2c. Quality management: Detecting and evaluating welding defects

Application examples

Check-out knowledge test

# 3. Localisation: Metal

## Topic: Welding Roboter

- Welding robots are industrial robots that work flexibly, quickly and reliably.
- They are classified as automation technology.
- The task of these robots is to weld products automatically in a wide variety of production environments.

## Goals: Functionality, structure and safety knowledges

- The goal is to provide the participants with a basic overview of the functionality, structure and occupational safety when handling a welding robot.

## Objectives: Quality management skills

- The training serves to impart basic welding knowledge, in particular the recognition of external welding seam irregularities.
- The use of measuring equipment and pictures for target/actual comparison should make it easier to recognise and evaluate weld seam faults.
- Causes for occurring weld defects should also be localised, forwarded to the appropriate welding supervisor and repaired.

# 3. Localisation: Metal

Check-in knowledge test

**Assign the following components to the robot shown:**

- carousel,
- swing arm,
- base frame,
- arm,
- central hand

# 3. Localisation: Metal

## Check-in knowledge test

### Name the main hazards of a robot:

- Explosion hazard
- Danger from electric current
- Risk of injury due to unpredictable and complex movements

### What is the function of the shielding gas in welding?

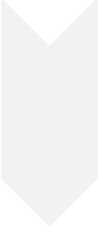

- Protection of the weld pool against air ingress
- Cooling of the weld pool
- The shielding gas has no special task

# 3. Localisation: Metal

## Check-in knowledge test

**Which rays can cause burns while welding on uncovered parts of the body?**

- X-rays
- Light rays
- Ultraviolet rays (UV rays)

**How do pores form in a weld?**

- Current intensity set too high
- Workpiece not cleaned, dirty surface
- Wrong amount of shielding gas

# 3. Localisation: Metal

Self-learning phases, each with a subsequent test  
2a. Welding robots: components and mode of operation

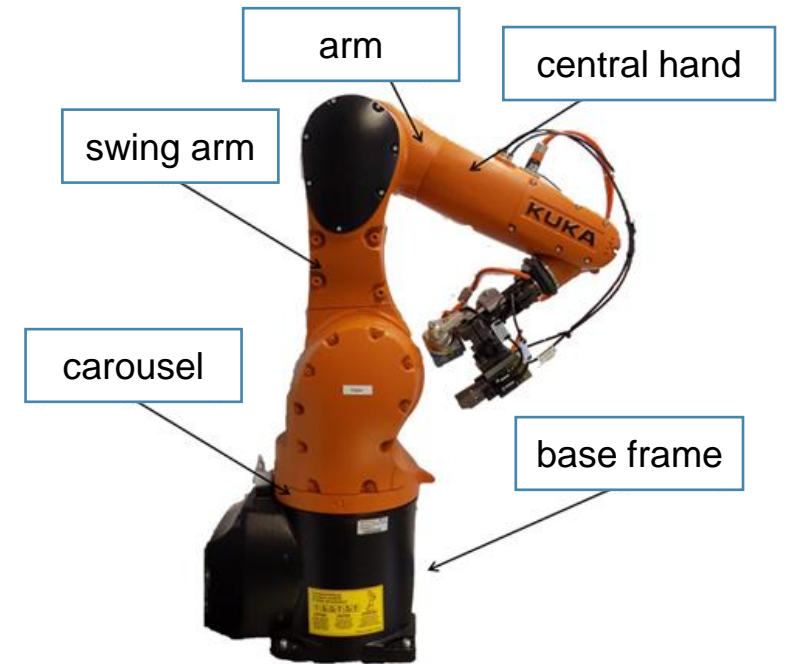

## Learning objectives:

- Overview of how a robot works
- Correct naming of the individual components

## Contents: Structure of the robot system

The structure of the robot system and the individual components are to be explained.

The robot system consists of three main components. These are shown in the following picture:

# 3. Localisation: Metal

Self-learning phases, each with a subsequent test  
2a. Welding robots: components and mode of operation

## Contents: Structure of the robot system

- The **central hand** of the robot comprises three axes (A4, A5, A6) and forms the end of the robot arm. On the central hand there are three 5/2-way solenoid valves and a CAT5 data line, which can be used to control tools.
- In front of this is the **arm**, which is moved by axis A3. In the robot, the arm represents the connection between the central hand and the swing arm.
- The **swing arm** contains the power supply lines for axes 2 to 6.
- The **carousel** is responsible for the rotary motion of the robot (axis A1) and is connected to the base frame via a gearbox.
- The **base frame** forms the basis of the robot. The interfaces between the robot mechanics and the control system are located on the base frame.

# 3. Localisation: Metal

Self-learning phases, each with a subsequent test  
2a. Welding robots: components and mode of operation

## Contents: Structure of the robot system

- Each robot has both mechanical limit stops and electronic limit switches (software limit switches). Among other things, this mechanically prevents the robot from turning more than 190°. In addition, the range of movement can be limited via the robot programme. If one of these end positions is reached, a fault (workspace error) is signalled so that no damage can occur to the robot.
- The individual axes of robots are driven by servo motors. Compared to hydraulic motors, these are much quieter and more flexible. Furthermore, the work is more precise and well suited for high repetition accuracy. In addition, there are different ways to equip the hand (effector) of the robot.
- In the case of the BBS2 robot, a pneumatic gripper is installed. This is controlled via one of the 5/2 directional control valves in the central hand. In addition, inductive sensors have been installed to detect the current state of the gripper (open; closed). Furthermore, an optical component check has been integrated to determine whether the robot has picked up the workpiece correctly.

# 3. Localisation: Metal

Self-learning phases, each with a subsequent test  
2b. Welding: Basics and Safety

## Learning objectives

- To know the dangers of working with robots and
- Work safely with robots

## Contents:

- Operating the robot without external safety measures is not permitted and is also prohibited by the manufacturer!
- Operating a robot without safety measures can have fatal consequences. Overestimation of one's own capabilities or gross negligence can injure not only the operator himself but also other persons.
- If protective devices are bypassed or deactivated, the operator can move freely in the danger zone.
- In the case of ill-considered travel movements in manual mode or an automatic start-up of the drives, the human is completely at the mercy of the robot.
- In most cases, there is no collision detection, so everyone has to rely on the additional protective devices (safety grid, light curtain, safety door, etc.).

# 3. Localisation: Metal

Self-learning phases, each with a subsequent test  
2b. Welding: Basics and Safety

## Contents: Safety measures

- Special safety instructions or training are just as necessary as a very good understanding of the safety regulations of the respective industrial robot.
- Likewise, an assessment of the possible dangers must be made before starting work.
- The operator of the plant in which the robot is installed can provide support.
- Both the obligation to monitor and the obligation to instruct must be fulfilled.
- Among other things, attention is paid to safety-related integration, in which, for example, the following points are addressed:
  - Preparation of operating instructions for the system
  - Carrying out a risk assessment
  - Use of the necessary safety functions and protective devices
  - Selection of persons who are suitable and competent for the work

# 3. Localisation: Metal

Self-learning phases, each with a subsequent test  
2b. Welding: Basics and Safety

## Learning objectives:

- Getting to know the function and structure of a MAG welding machine
- Evaluating welds on the basis of external irregularities

## Contents:

- MAG welding belongs to the group of gas-shielded metal arc welding processes in which a wire electrode is melted under inert gas and is particularly common in industrial manufacturing for joining metallic materials.
- In MAG welding, the permanent joining of metals is achieved using intense heat and welding consumables. The heat input for the fusion welding process is provided by an electric arc. The wire electrode used flows together with the molten base material as a welding filler and contributes to the formation of the weld seam.
- The process is characterised by a high processing speed and the possibility of automation. It is therefore particularly suitable for industrial applications.

# 3. Localisation: Metal

Self-learning phases, each with a subsequent test  
2b. Welding: Safety

## Learning objectives:

- Recognise the dangers of welding and observe and apply appropriate safety precautions.

## Contents: General

- Welding processes are classified according to the energies used, such as gas, electricity, laser or friction.
- The electrical processes are of great importance. This includes, for example, metal active gas welding (MAG).
- If you want to implement measures to promote safe welding, it is important to bear in mind: Each process involves different risks, such as optical radiation, electric current, fire and explosion hazards, the release of hazardous gases and fumes or the displacement of oxygen in the air we breathe.

# 3. Localisation: Metal

Self-learning phases, each with a subsequent test  
2b. Welding: Safety

## Contents: Electrical hazards

- An electrical hazard begins when a voltage higher than 25 V AC (rms) or 60 V DC can be touched and a sufficiently high current could flow. Therefore, a first protective measure must be implemented as basic protection (e.g. insulation).

## Contents: Pollutants

- When welding smoke forms, there is a chain of physical and chemical processes behind it. The pollutants in welding fumes are also formed from very different elements during the welding process.
- Welding fumes are produced when an arc or flame hits a material at high temperatures.
- Physical and chemical processes take place, such as evaporation, condensation, oxidation, decomposition, pyrolysis (thermal-chemical splitting) or combustion.
- Pollutants are produced which can be formed from: Filler materials - Base materials - Protective gases - Coatings - Contaminants - Ambient air.
- The concentration of all these hazardous substances in the air at the workplace must be determined by measurements.
- According to the Occupational Health and Safety Act, the employer is obliged to take the necessary measures against these hazards. Accordingly, the correct extraction equipment must be installed depending on the process, material and the resulting welding fumes.

# 3. Localisation: Metal

Self-learning phases, each with a subsequent test  
2b. Welding: Safety

## Contents: Optical radiation (UV radiation)

- The human body has no sensory organ for ultraviolet radiation.
- The human body needs small amounts of UV radiation for the formation of vitamin D. However, too high doses are harmful to humans.
- UV radiation causes, among other things, blinding of the eyes by causing inflammation of the outer eye (conjunctivitis).
- Other effects of UV radiation are also not felt by humans until it is too late.
- Short-term high doses of UV radiation lead to sunburn, in welding for example to the so-called "welder's tie" (the burn of the uncovered area between the shirt and the face shield).
- In the long term, too high doses can lead to skin cancer and cataracts (clouding of the lens of the eye).

# 3. Localisation: Metal

Self-learning phases, each with a subsequent test  
2b. Welding: Safety

## Contents: Safety measures

- To avoid skin and eye damage, the whole body must be protected from radiation exposure.
- Face protection is required. A welding helmet is preferable to a protective shield so that the temples are also adequately covered. Covers for the top of the skull, neck and throat should also be attached to this hard hat.
- All parts of the skin that are not covered by the protective clothing must be protected, e.g. if necessary, by the protective bonnet and by using a UV skin protection cream specially made for welding.
- In this way, persons at welding workplaces are not only protected against radiation from neighbouring workplaces, but also against radiation reflected from the walls or the workpieces

# 3. Localisation: Metal

Self-learning phases, each with a subsequent test  
2c. Quality management: Detecting and evaluating welding defects

## Learning objectives: Detection of weld defects

### Contents: Weld defects

- Welding seam defects of a welded joint are an expression of a reduced manufacturing quality.
- No statements can be made about the serviceability of the manufactured product if they are detected.
- Geometric irregularities in metallic welded joints are described in DIN EN ISO 6520 Parts 1 and 2.
- A distinction is made between internal and external irregularities. These include:
  - Cracks
  - Cavities (pores)
  - Solid inclusions
  - Binding defects and insufficient welding penetration
  - Shape and dimensional deviations
  - Other irregularities.

# 3. Localisation: Metal

Self-learning phases, each with a subsequent test  
2c. Quality management: Detecting and evaluating welding defects

## Contents: Cracks

- Cracks often occur due to an unsuitable base material or the selection of the wrong filler metal.
- High stresses in the weld assembly can also lead to cracking.
- A crack in a weld is an impermissible irregularity, as component failure is often the result.

## Contents: Seam cant

- A seam cant is a geometric irregularity and is tolerated up to a certain deviation.
- The cross-section of a fillet weld (picture) should ideally correspond to an isosceles triangle. Excessive superelevation has disadvantages in terms of strength.
- The height or fillet weld dimension is calculated in advance and shown in technical documents.

# 3. Localisation: Metal

## Application examples

### Exercise: Weld failures detection

- A welding assembly is inserted into the robot system. The assembly is fixed with the provided clamping device and the safety doors are closed.
- After the production process has run automatically, you open the safety door and remove the assembly. This is followed by a routine visual inspection of all existing weld seams.
- You notice the following irregularities:

# 3. Localisation: Metal

Check-out knowledge test

**What irregularity do you see ?**

- Pores
- burn-in notch
- large weld protrusion

**What could be the cause of the irregularity shown?**

- Fault in the shielding gas supply
- Unclean workpiece surfaces
- Too high current intensity.

**What is the cause of the following imperfection?**

- Unclean workpiece surfaces
- Poor fitting accuracy of the parts to each other

# Agenda - Day 3

## Proposals for implementation of our European Training Module within the national curriculum

**2.1 PROPOSALS METAL SECTOR**

Drag and drop a heart to other people's ideas if you like them or agree with them.

Localization of the Training Module in VET or in-company training (depending on the specific topic)

Germany	Spain	Greece	Bulgaria	Poland
Contents specific vs. common	Training in-company (end users: company workers)	Trainers Training	in-company training	DUAM VET training
Time for working on the training module	Decide the degree of training according to the VET Law of March 2022 (A, B, C, D, E)	Educational content that ensures the adequacy of basic skills	online parts	More discussion about profession before decided to start raining and change profession Share your idea here
Resources and practical issues	Decide whether the training is level 1, level 2 or level 3.	Online training modules	self education with provided materials	Include more metrology and digital tools in it
Technical equipment	Modular design for generation of specific itineraries adapted to the needs of each company	Flexible VET	self assessment	unification of course content throughout Europe
Financial support shall be managed		Continuing Professional Training	networking with peers	PLATFORM for CET teacher for all topic to share experience INTERNATIONAL
		In job training		

**2.1 PROPOSALS ELECTRO SECTOR**

Drag and drop a heart to other people's ideas if you like them or agree with them.

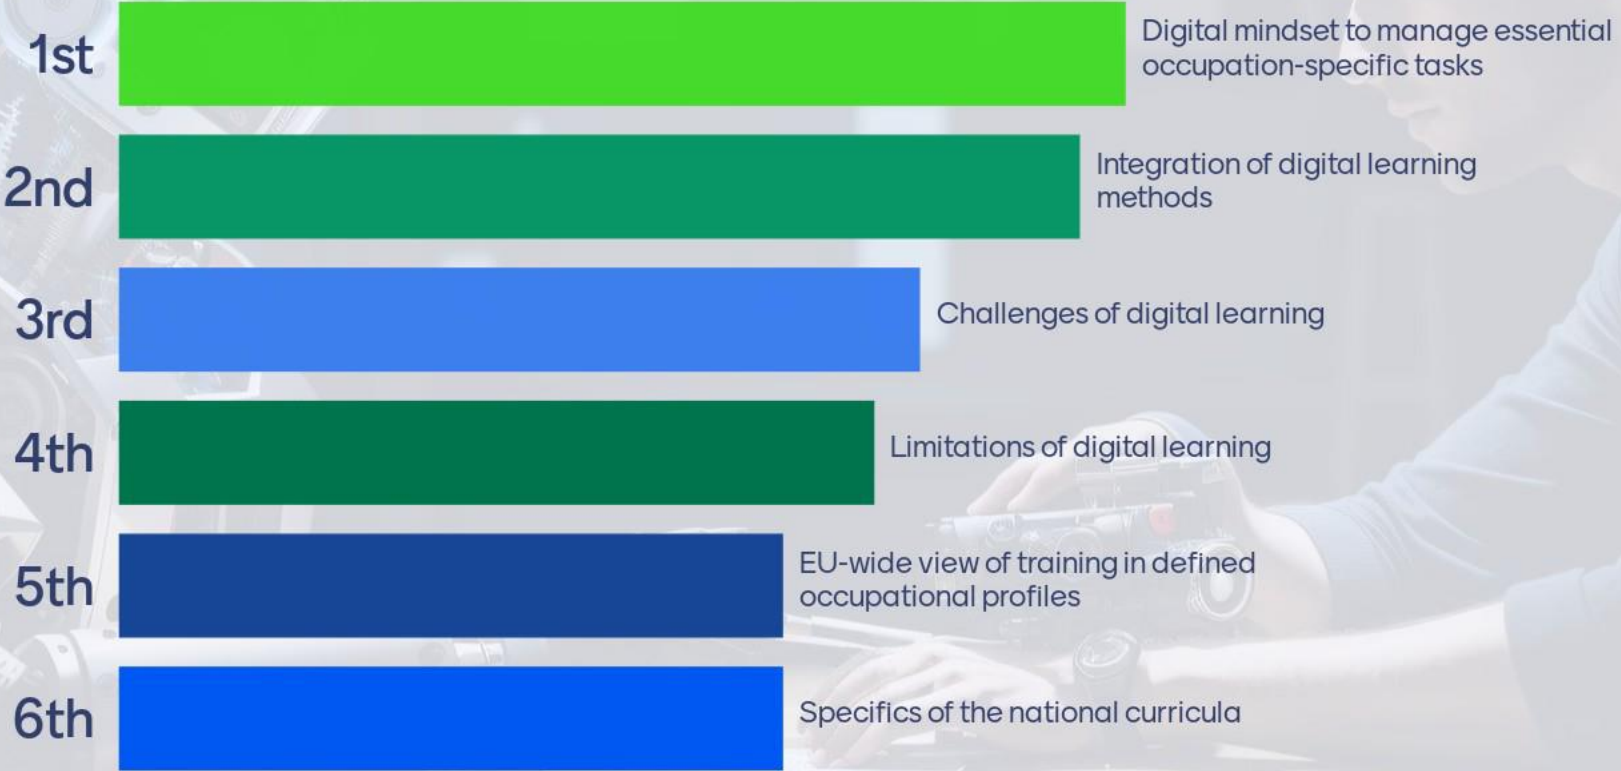

Localization of the Training Module in VET or in-company training (depending on the specific topic)

Germany	Spain	Greece	Bulgaria	Poland
Safety issues	Decide the degree of training according to the FP Law of March 2022 (A, B, C, D, E)	Training in new sectors (PV, Renewable energy)	In- company training	More discussion about profession before decided to start raining and change profession
Audio and visual appropriate design	Decide on the vocational family to which the training is addressed: Mechanical manufacturing, Electricity-electronics, Energy and water or other. 1st

Possible adaption of vocational training concepts to the needs of companies

2nd

job-related issues of vocational education and training

3rd

specific competence requirements for selected occupational profiles

4th

general competence requirements for apprentices

# How can you use the findings of today's event?

A top-down view of several hands of different skin tones stacked together on a wooden desk. The hands are positioned in a circle, with fingers overlapping. In the background, there is a laptop, a smartphone, a coffee cup, and a spiral notebook. The overall scene conveys a sense of collaboration and appreciation.

Thank you!
